

Knowledge Base — Pablos (OP Edition)

Author: Tama

Agent: Pablos (Llama-70B)

Version: v1.0

1) Core Topics (Fokus Utama)

Backend Development

- **Laravel Expert** → struktur MVC, service container, middleware, Eloquent ORM, testing (Pest/PHPUnit).
- **API Integrations** → REST, GraphQL, gRPC. Auth via OAuth2/JWT. Rate-limit & caching best practices.
- **Microservices** → komunikasi via message broker (RabbitMQ, Kafka), API gateway, circuit breaker.
- **Database** → MySQL/MariaDB, PostgreSQL, MongoDB. Optimisasi query, index tuning, migrations.
- **Security** → XSS, CSRF, SQLi, SSRF, auth hardening, input validation, secure headers.

OSINT & Data Validation

- **Data Gathering** → whois, DNS, Shodan, Censys, social scraping (dengan API legal).
- **Validation** → cross-check sumber data (multi-API), hash verification, anomaly detection.
- **Frameworks** → Maltego, recon-ng, custom Laravel pipelines untuk data ingestion & cleaning.

Fullstack & Integration

- **JS Family** → Node.js, React, Next.js. Event loop & async.
- **Mobile** → Flutter, React Native. Integrasi API backend.
- **Bridging** → integrasi Laravel ↔ Java (Spring), ↔ Flutter, ↔ React.

DevOps & Deployment

- **Containerization** → Docker best practices, docker-compose, multi-stage builds.
- **CI/CD** → GitHub Actions, GitLab CI, Jenkins.
- **Infra** → Nginx, Traefik, reverse proxy, SSL automation (Let's Encrypt).
- **Monitoring** → Prometheus, Grafana, ELK, Sentry.

Productivity & Workflow

- **Git Discipline** → commit message convention (Conventional Commits), branching (Git Flow, trunk-based).
 - **Project Mgmt** → Agile/Scrum, Kanban, Jira, Notion.
 - **Documentation** → README standar, API docs (OpenAPI/Swagger), ADR (Architecture Decision Records).
-

2) Knowledge Snippets (Siap Recall Cepat)

Laravel

- Route caching: `php artisan route:cache`
- Config caching: `php artisan config:cache`
- Queue worker daemon: `php artisan queue:work --daemon`
- Migration rollback 1 step: `php artisan migrate:rollback --step=1`

Git Flow

```
# new feature branch
git checkout -b feat/login-ui

# commit dengan conventional commits
feat(auth): add login form with validation

# merge via PR → squash & merge
```

Dockerfile Multi-Stage

```
FROM php:8.2-cli as build
WORKDIR /app
COPY . .
RUN composer install --no-dev --optimize-autoloader

FROM php:8.2-fpm
WORKDIR /app
COPY --from=build /app .
```

API Response Format (standar JSON)

```
{
  "status": "success",
  "data": {},
  "errors": []
}
```

Security Checklist (Deploy)

1. Disable debug mode (`APP_DEBUG=false`).
2. Use HTTPS only.
3. Rate limiting (Laravel Throttle).
4. Sanitize all input.

5. Harden server: firewall, fail2ban.

3) Quick Reference Tables

Domain	Tool/Lib	Notes
Backend	Laravel, Lumen	API & microservice ready
Frontend	React, Next.js	SSR, SPA, hydration
Mobile	Flutter	Cross-platform, API first
DB	MySQL, Postgres	Index, partition, jsonb
OSINT	Shodan, Maltego	Recon, validation
DevOps	Docker, Nginx, CI	Deploy & scale
Docs	Swagger, Markdown	Share & onboard cepat

4) Best Practices Capsule

- **Coding:** Clean Code, SOLID, DRY, YAGNI.
 - **Testing:** TDD light → unit + integration, mocking eksternal API.
 - **Ops:** Infra as Code (Terraform/Ansible).
 - **Security:** "Shift left" — testing sejak dev, bukan production only.
 - **Team:** Commit kecil, review cepat, CI green → merge.
-

5) Expansion Slots

Tambahkan: - **Domain khusus** (mis. fintech, blockchain, AI/ML). - **Cheatsheet** untuk bahasa/framework baru. - **Playbook** untuk incident response / pentest.

⚡ **Pablos Knowledge Base siap dipakai** — tinggal plug ke agent untuk instant recall & context injection.
